Range added/hr: 3-5 miles

Cost to charge: \$

Location: Home / Office

Problem Definition

The transformers in the distribution systems of the Metropolitan Electricity Authority (MEA) and Provincial Electricity Authority (PEA) frequently experience problems due to overloading, which can cause fuses to cut off and result in power outages. As the use of electric vehicles is becoming more common, and usage patterns are becoming more synchronized, if smart meters can communicate with chargers in users' homes, it would help manage energy distribution for electric vehicles charging, allowing transformers to supply power continuously without overloading.

Benefits to EV Users

EV users will be notified when there is an increase in usage load in order to manage the charging time so that they will be able to manage Their time schedule.

Benefits to Electricity provider

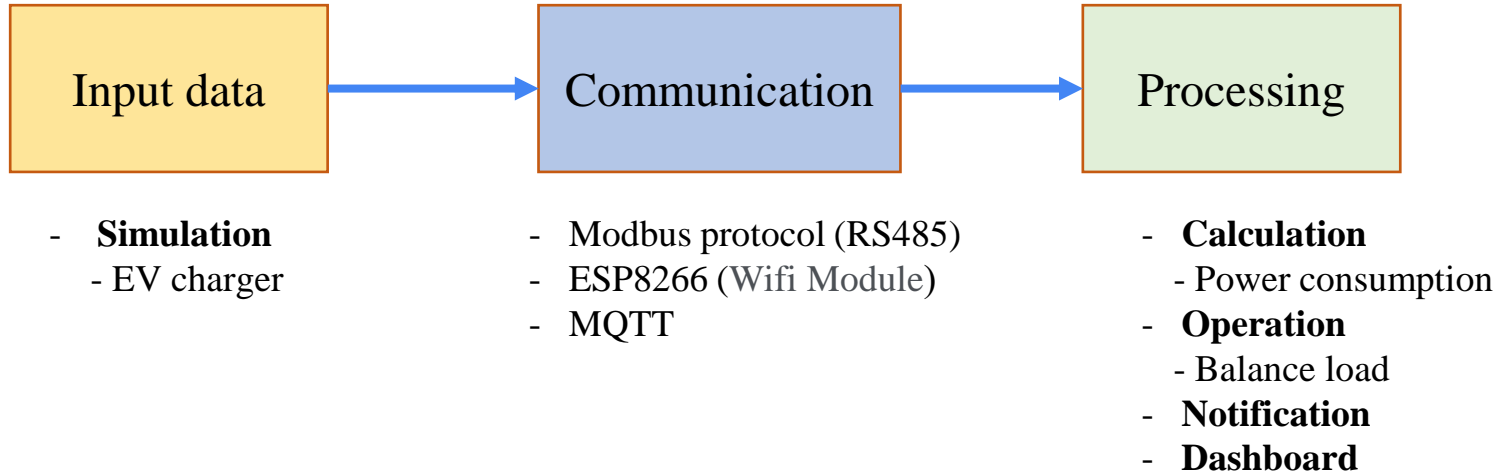

Electricity provider can use the data on the dashboard to plan for budgeting for improvements to the distribution system (such as increasing the size of transformers).

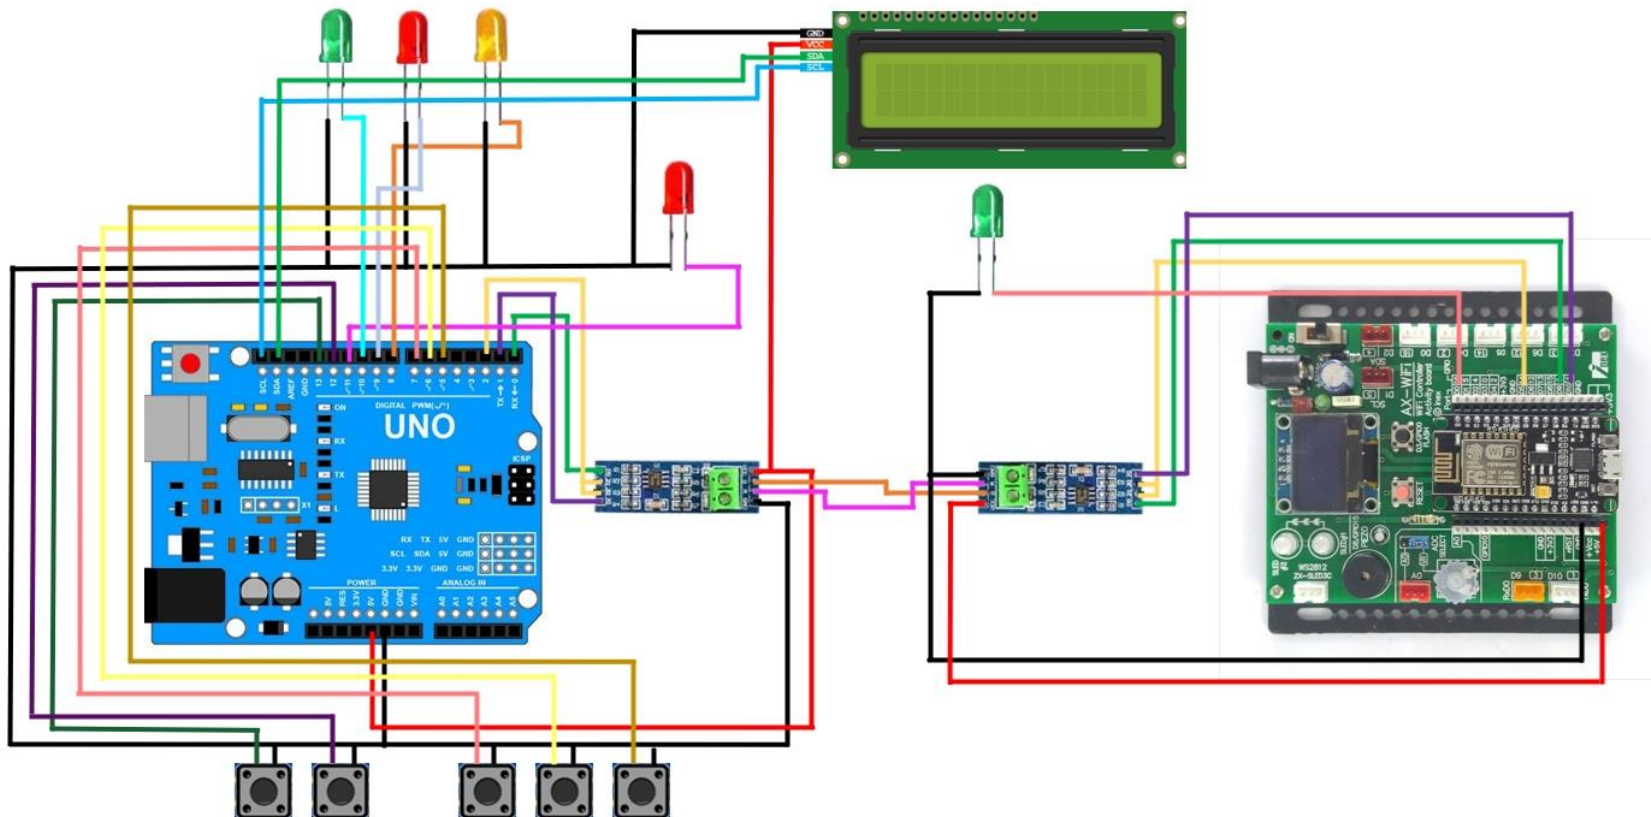

Initial concept

Divided into three parts

- Input - data (Simulation)
- Communication part
- Processing part

Wiring diagram

Related techniques

- **Modbus protocol**

It is an Open Protocol that can be used free of charge. The device that requires data is called Modbus Master (Client), while the device that provides data is called Modbus Slave (Server).

- **Type of Modbus**

- **Modbus Serial**

- It is a communication by sending data along a serial cable between devices. The simplest communication method is to connect a serial cable between master and slave.

- **Modbus TCP/IP**

- Ethernet communication is used with devices such as Ethernet Devices. A repeater can be connected to extend the distance without limits.

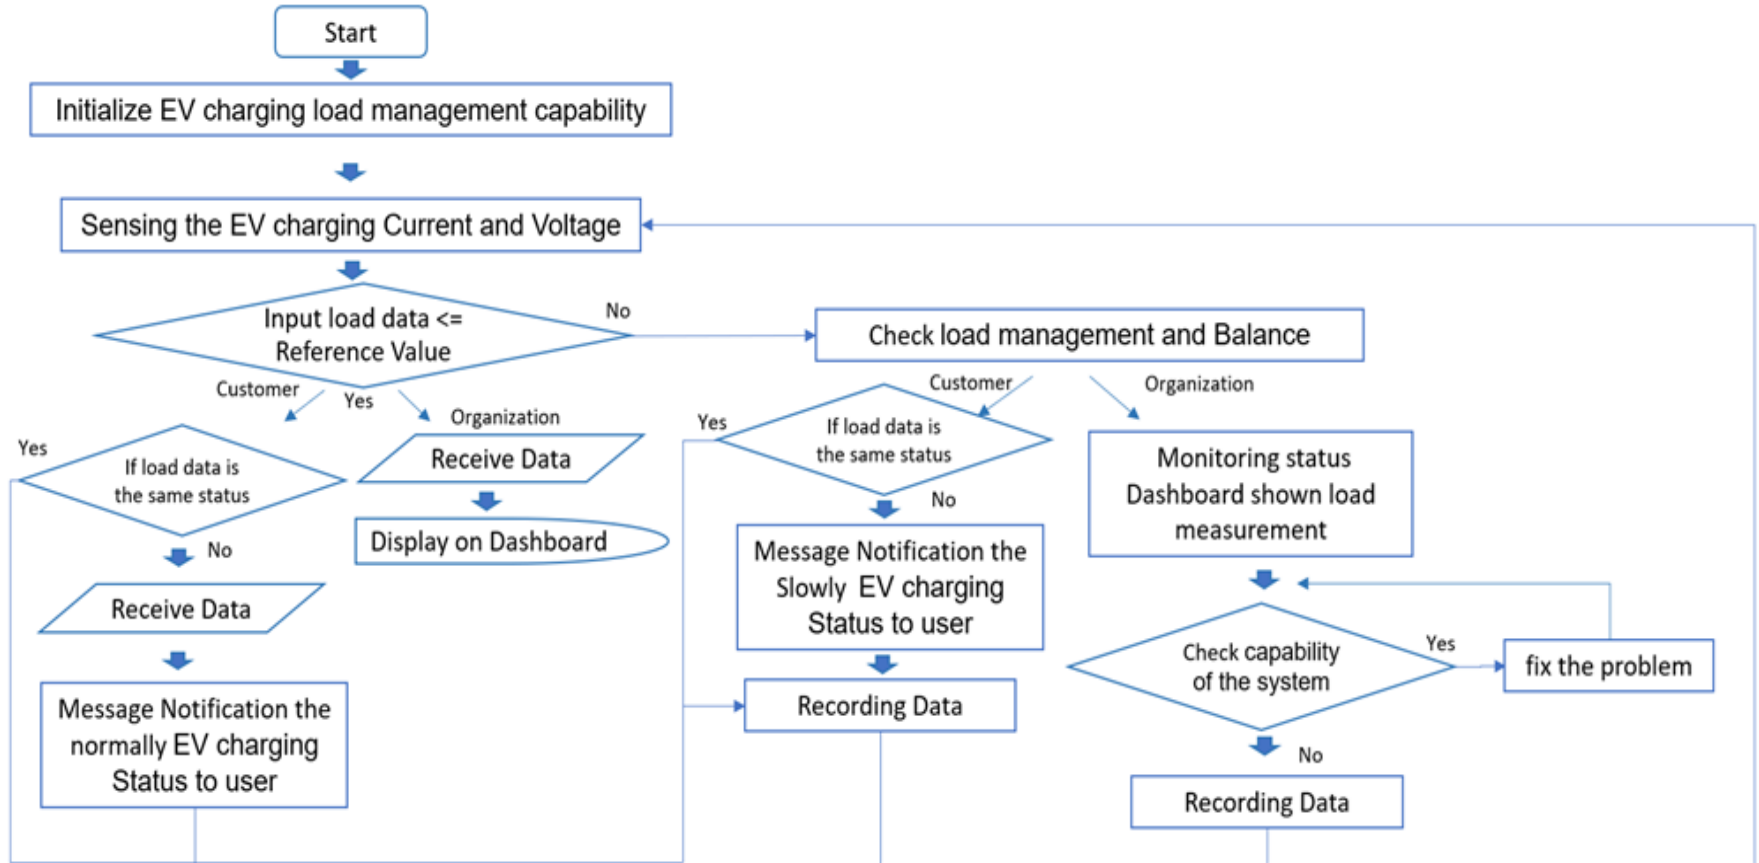

Related techniques

- MQTT protocol

MQTT is a standards-based messaging protocol. Or a set of rules used for machine-to-machine communication.

Flowchart of system

What about project

We simulate a village with 100 kVA transformers and 6 chargers.

Charger 1 = 20 kW

Charger 2 = 25 kW

Charger 3 = 30 kW

Charger 4 = 27 kW

Charger 5 = 23 kW

Charger 6 = 15 kW

Data Feed Histories (Sampling in Minute)

Conclusion

- **Input and communication**
 - Add and remove EV from the system including power adjustment for each EV user
 - Transmit and receive input and processing parts working on Modbus with load balancing function
 - The power consumption will be displays on LCD screen to check the correct information between the data sent from Modbus and shown on the dashboard
- **Dashboard**
 - Devices connects via Netpie, which stores their information
 - Display the required data like power consumption which will be able to export data to excel
- **Notification**
 - Users receive information about the percentage of charging when power load has fallen below 100% and goes back to a normal state
 - Immediately, the charger is full this data will be transmitted to the user via line notification
